

CHANGE LOG DOCUMENT

Reference Template for Document Validation System

1. Introduction

1.1 Purpose

Describe the purpose of this Change Log Document. Mention the system name and explain what developmental changes, asset revisions, trackable modifications, and systemic alterations this document is intended to define.

1.2 Scope

Describe the scope of the tracked system changes. Explain which codebase modifications, features, refactoring tracks, and version histories are included and what is not covered by this document.

1.3 Definitions, Acronyms, and Abbreviations

List important terms, acronyms, and abbreviations used in the document.

Term	Description
CL	Change Log
Deprecated	Code features slated for deletion in upcoming cycles
Refactor	Restructuring internal codebase without altering outward behavior

1.4 References

List any documents, standards, or resources referred to when preparing this Change Log, such as git commit records, project ticketing tracks, or change request forms.

1.5 Document Overview

Briefly explain how the rest of the document is organized.

2. Functional Overview

2.1 System Functions

List the primary functions modified by changes in this log.

- Modified login processing validation parameters
- Optimized background file streaming mechanics
- Revised validation logic schemas
- Fixed analytical dashboard charting bugs
- Updated administrative deletion checks

2.2 User Classes and Characteristics

Describe the user archetypes affected by the recorded alterations.

- Admin
- Registered User
- Guest User

2.3 Operating Environment

Describe hardware settings, branch management protocols, library versions, or infrastructure dependencies linked to these system modifications.

3. Functional Requirements

3.1 Detailed Functional Requirements

Describe each specific change performed in the system, with a unique tracking identifier and priority rating.

Requirement ID	Description	Priority
CL-01	The system change shall add strict email validation formatting patterns.	High
CL-02	The system change shall fix database connection leaks during peak loads.	High
CL-03	The system change shall update memory thresholds for PDF upload parsers.	High
CL-04	The system change shall swap obsolete extraction packages for modern variants.	High
CL-05	The system change shall modify verification response payloads for UI syncs.	High
CL-06	The system change shall adjust report export formatting configurations.	Medium
CL-07	The system change shall add clean sorting indices inside admin configuration screens.	Medium

4. External Interface Requirements

4.1 User Interface Requirements

Describe the user interface changes registered in this log.

- The system interface shall cleanly render updated input parameters across system pages.
- The system forms shall show clearer error labels when operations hit revised threshold limits.
- The system shall output explicit warning banners for deprecated system workflows.

4.2 Software Interface Requirements

Describe altered software components, APIs, databases, or data fields impacted by these changes.

- The system updates may deprecate historical v1 API transaction endpoints.
- The system adjustments may bind modified column schemas to central logging tables.
- The system refactoring may connect modern external validation services to core channels.

5. Business Rules

5.1 Rules and Constraints

Define the business change rules and review criteria that the system tracking workflows must enforce.

- Every logged entry must cleanly link directly to an approved pull request or ticket identifier.
- Changes must state precisely whether their implementation introduces breaking modifications.
- Code updates must undergo integration review criteria prior to entering the master log.
- The alteration status determines acceptance into production states.

6. Non-Functional Requirements

6.1 Performance Requirements

- Modified code components shall execute processes within an optimal time limit.
- Altered background routines shall manage massive parallel executions cleanly without resource leaks.

6.2 Security Requirements

- Review trails tracking system updates shall preserve immutable audit records.
- Modified data models shall maintain tight data masking security principles.
- Secret system configurations updated during changes shall be securely masked.

6.3 Usability Requirements

- The engineering log files shall maintain clean, readable Markdown layout configurations.
- Version tracking indices must be clear to navigate for incoming engineers.

7. Validation Rules

7.1 Required Sections

The uploaded Change Log document should include the following main sections:

- Introduction
- Functional Overview
- Functional Requirements
- External Interface Requirements
- Business Rules
- Non-Functional Requirements

- Validation Rules
- Appendices

7.2 Validation Criteria

The document validation system should check:

- Whether required sections are available
- Whether section names are similar to the Change Log template
- Whether sections follow the correct order
- Whether unrelated extra sections are included
- Whether the document belongs to the correct document type

7.3 Scoring Criteria

Score Range	Validation Result
75-100	Accept
50-74	Needs Improvement
0-49	Reject

8. Appendices

8.1 Appendix A: Functional Use Cases

Insert detailed code diff comparisons, pull request parameters, or branch strategy models if available.

8.2 Appendix B: Additional Information

Include any extra operational notes or environment variable tracking related to the system changes.
